[57] ABSTRACT

Film transparency displays to be viewed by projecting light through them as mounted on light reflecting surfaces, windows, light boxes, overhead projectors and slide projectors are made by imprinting an image on a soft flexible transparent film with at least one glossy surface. Such flexible film transparencies adhere without adhesives or other aids to smooth, hard, glossy surfaces such as glass, acrylics, and other plastics. The flexible film transparencies are stored on indexed light reflecting pages having smooth hard glossy surfaces which may be bound in books. Slides are made by adhering flexible film transparencies to acrylic plates, and photographic films may be adhered to the flexible film transparencies.
